

Due Date: Friday, October 9 at 11:59 PM

Overview: In this assignment, you'll practice working with a public API by connecting an application to the GameBrain. The goal of this assignment is to help you understand how APIs work, how to make requests to a secured API, how to work with JSON data, and how to use JS to dynamically update a webpage.

Your task: You'll retrieve information about games, their, and their, then use JS to display that information on a provided project.

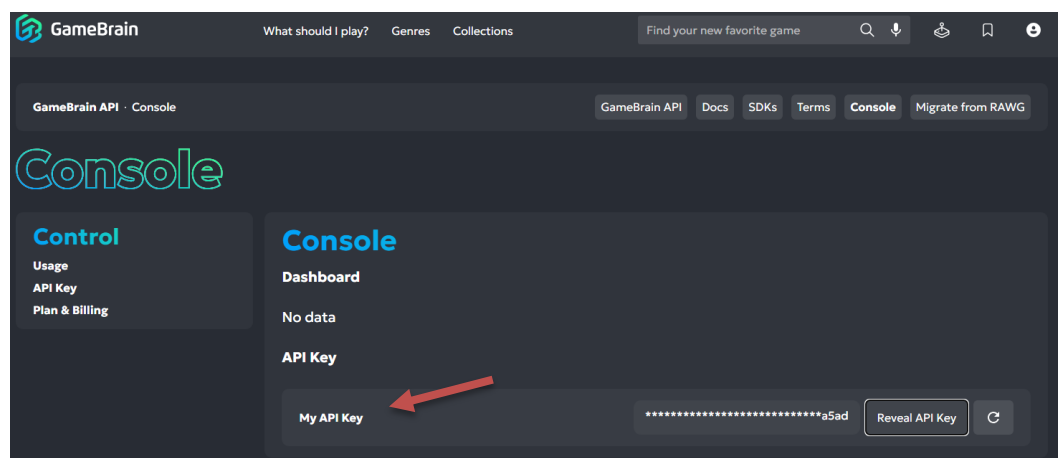

Requirements:

1. Sign up for a free API. Before you can make requests to GameBrain API, you'll need to create an account and obtain an API key. Follow their instructions in the link below to create an account.

<https://gamebrain.co/api/docs/quickstart>

NOTE: After you create an account, you'll be presented some options like "My gaming platform", "My Wishlist", etc.... you can ignore this, and simply look for the X to close the window to reveal your dashboard.

You'll find your API key under the console.

2. Test access to one of the API's endpoints. I recommend you to use Postman.

- a. Make a **GET** request to the **secure** API:
`https://accounts.spotify.com/api/token`

GET `https://api.gamebrain.co/v1/games?query=medieval+strategy+games` Send

Docs Params Authorization Headers (6) Body Scripts Settings Cookies

Query Params

Key	Value	Description
query	medieval+strategy+games	

Body Cookies Headers (17) Test Results

401 Unauthorized • 333 ms • 1.08 KB

Missed authorization? [Set Up New Authorization](#)

```
1 {
2   "status": "failure",
3   "code": 401,
4   "message": "Please read https://gamebrain.co/api/docs/authentication"
5 }
```

NOTE: Since it is a secured API, using the API without an API key will result in a 401 error

- b. Add the key from GameBrain as a parameter to the endpoint and re-test:

Key **Value**
api-key your_api_key

GET `https://api.gamebrain.co/v1/games?query=medieval+strategy+games&api-key=6e663f7342dc4c13bb4a00aeb62ca5ad` Send

Docs Params Authorization Headers (6) Body Scripts Settings Cookies

Query Params

Key	Value	Description
query	medieval+strategy+games	
api-key	6e663f7342dc4c13bb4a00aeb62ca5ad	

Body Cookies Headers (20) Test Results

200 OK • 653 ms • 4.77 KB

```
1 {
2   "sorting": {
3     "key": null,
4     "direction": null
5   },
6   "active_filter_options": [
7     {
8       "key": "theme",
9       "connection": "AND",
10      "values": [
11        {
12          "value": "medieval"
13        }
14      ]
15    }
16  ]
17 }
```

A game as a JSON Object

If all is good, the response will return JSON data. Pay attention to how the JSON object is structured.

You will likely use the following endpoints:

- c. Search Games. Use this endpoint to retrieve information about all games that match some criteria. For example: when searching for medieval strategy games, the API returns a collection of JSON objects. Use it to find the ID of a specific game.

`https://api.gamebrain.co/v1/games?query=medieval+strategy+games`

more details: <https://gamebrain.co/api/docs/search-games>

- d. Game Details. Use this endpoint along with a game ID to retrieve information about a specific game.

`https://api.gamebrain.co/v1/games/{id}`

more details: <https://gamebrain.co/api/docs/game-detail>

- e. Game News. Use this endpoint along with a game ID to retrieve information about news, tutorials, and any article related to the game:

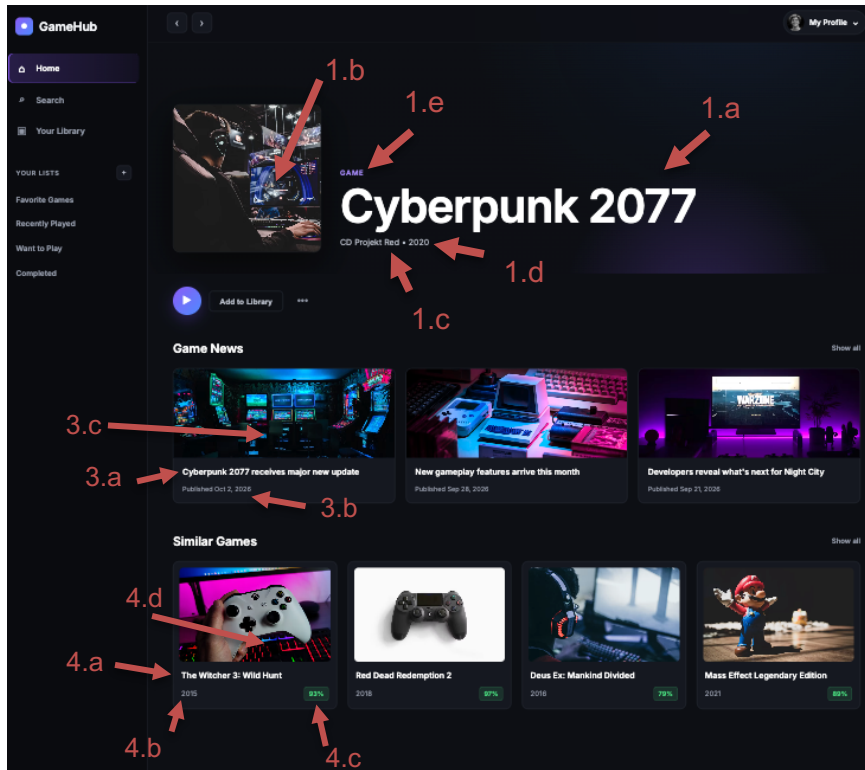

`https://api.gamebrain.co/v1/games/{id}/news`

more details: <https://gamebrain.co/api/docs/game-news>

- 3. Update a webpage dynamically. A ZIP folder with a starter project is provided to you on Brightspace. Focus development on the JS file. You should **not change, add, or remove HTML elements** in the starter project. Instead, use JS to find the existing HTML elements and update their contents.

For this part of the assignment, you can select your favorite game and game details. **Make sure that details and news are available for the game selected.** Here's a list of the elements that should be dynamically populated using data from the various GameBrain API endpoints:

1. Change the Hero section
 - a. game title.
 - b. artwork/image.
 - c. developer
 - d. release date (must be formatted by using the `formatYearFromStr()` function to display the year only)
 - e. genre
2. In the Game News section, at most three **news** items. If there are no news for your selected game, use the news ID in the documentation page.
 - a. title
 - b. published
 - c. artwork/image
3. In the Similar Games section, at most four **similar game** items:
 - a. name
 - b. year (must be formatted to use the integer part of the value returned as the year)
 - c. rating > mean (must be formatted by using the `formatPercentage()` function)
 - d. screenshot (choose only one image)

Hint: Use methods such as:

- `document.querySelector()`
- `document.querySelectorAll()`
- `element.textContent`
- `element.src`
- the `fetchAPI`:

```
...
const response = await
fetch(`https://api.gamebrain.co/v1/games/${gameId}?api-key= ${key}`);

const artist = await response.json();
...
```

Submission: Your solution must be hosted in GitHub, and **your repository should contain multiple commits** demonstrating your progress throughout the assignment. Use the Brightspace submission tools to submit a single text file containing the link to your GitHub repository.
